# THE PARKER PEN COMPANY

JANESVILLE, WIS., U. S. A.

Bulletin for Parker Distributors

No. 485

Date 20 de Noviembre de 1958

Subject: **SERVICIO:** Rajaduras de la Cápsula de la Parker 61

Habiendo recibido algunas quejas con respecto a grietas en la cápsula de plumas 61 reparadas en los mercados foráneos, hemos efectuado una investigación que descubre algunos datos interesantes.

**Cementos y Disolventes:** Algunas de las plumas examinadas demostraron que algunos de los cementos usados en la rosca del conector no eran del tipo recomendado.

Recomendamos el uso de los Cementos Nos. 720 ó 1182, que suministramos nosotros. Si las restricciones de importación en su país no les permiten obtener estos cementos, sugerimos que obtengan, localmente, una solución orgánica de caucho o de resina en hidrocarburos alifáticos. Estos cementos no deben contener alcohol, acetona ni ninguno de los disolventes del tipo de hidrocarburos aromáticos. Cementos con este tipo de disolventes afectan el plástico y pueden ser responsables de las grietas en la cápsula de la 61.

Si es del todo posible, importe los Cementos Nos. 720 ó 1182.

Si estos cementos se espesan, use un adelgazador en la forma de un hidrocarburo alifático. Recomendamos la "Bencina de petróleo". Cerciórese de que se trata de el destilado de petróleo y no un destilado de carbón de hulla, ya que este último agravará el problema.

El cemento seco, viejo, debe ser limpiado de la rosca del conector. Use para esto un cepillo de cerdas duras y, nuevamente, recomendamos el uso de un disolvente en la forma de un hidrocarburo alifático, tal como la Bencina.

**Torsión Correcta:** Cierta número de las plumas examinadas mostraban grietas o rajaduras en la cápsula debido al uso de fuerza exagerada al apretar la rosca de la cápsula. Extremo cuidado debe ejercerse al apretar la cápsula, usando solamente la fuerza mínima necesaria para hacer un buen ajuste.

**Sello:** La banda plástica circular, o "sello", que se encuentra sobre la cápsula de la celda entre el colector y el conector metálico, debe ser cuidadosamente examinado. Un sello torcido se arrugará al apretar el conector causando presiones contra la superficie interna de la cápsula plástica, que resultarán en rajaduras de la misma.

La observación de estos puntos en la reparación de plumas 61 es considerada de suma importancia, y agradeceremos su cooperación.

Muy atentamente,

División de Exportación

ROSS O. Fowler  
DHS/rjh
